Doc. Version	Date	Author	Description
1.0	2025-12-05	Name and surname	1.x version of the release

Requirements

The next table shows the requirements for the solution described.

Requirement	Description
RQ-001 Automated Task Service	Hangfire offers the possibility to manage automated task services to process PDFs
RQ-002 Indexer	The indexer libraries that contains the logic to process the PDFs
RQ-003 Model Layer	The model layer with EF core to interact with database
RQ-004 Web API	The back-end to execute CRUD operations in server
RQ-005 Front end App	Angular App to offer UI to manage the records and associated records
RQ-006 Database	The data model, full text search and index services and the logic needed by Stored Procedures

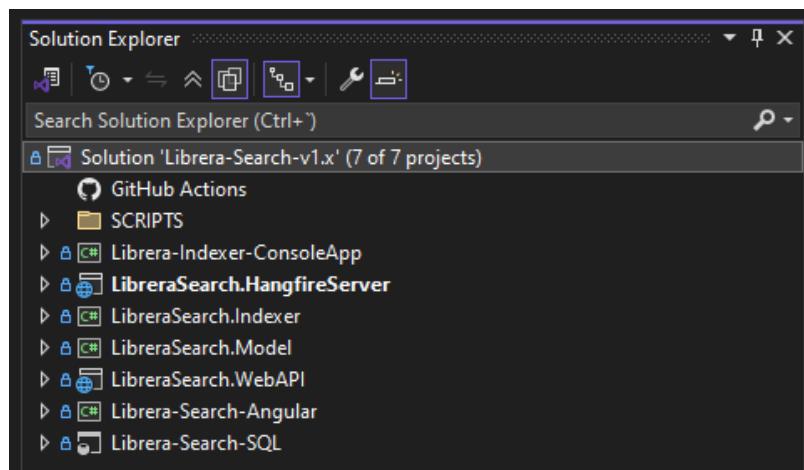

Overview

This document contains the technical details of the Librera Search v1.x solution built with Angular 16, Hangfire Server and .Net 8; enables to index content from PDFs making it searchable with the possibility to classify them by the Web UI. Implements token-based authentication for registered users and policy-based authorization in the endpoints.

The application contains the next functionality:

- Each register has id, title ,authors ,series, ids, published, publisher, languages, tags, formats, path and indexed content
- We can create, retrieve, update, delete records, launch the index service and search PDF content linked to the records
- Includes two pages for finding registers by title or search indexed content
- JWT (JSON Web Token) format used for authentication
- Policy-based authorization in the endpoints

Here the solution structure in Visual Studio 2022:

Scope

This first version of the solutions grants a view of how could be easily implemented in .NET 8 a simple but effective tool to manage book records and make content searchable using open source elements like Hangfire and front-end technologies like Angular.

RQ-01 | Automated Task Service

An easy way to perform background processing in .NET and .NET Core applications. No Windows Service or separate process required. Backed by persistent storage. Open and free for commercial use.

Here the Book Indexer Job definition in the dashboard:

The screenshot shows the Hangfire Dashboard for the 'BookIndexerJob'. The top navigation bar includes links for 'Hangfire Dashboard', 'Jobs (1)', 'Retries (0)', 'Recurring Jobs (1)', 'Servers (1)', and a 'Back to site' link. The main content area is titled 'BookIndexerJob' and displays the following information:

- Job Status:** The job is finished. It will be removed automatically *in a day*.
- Code Snippet:**

```
// Id: #15
using HangfireExample.Jobs;

var bookIndexerJob = Activate<BookIndexerJob>();
await bookIndexerJob.RunAsync();
```
- Parameters:**

CurrentCulture	"en-US"
CurrentUICulture	"en-US"
RecurringJobId	"BookIndexerJob"
Time	1764923111
- State:**

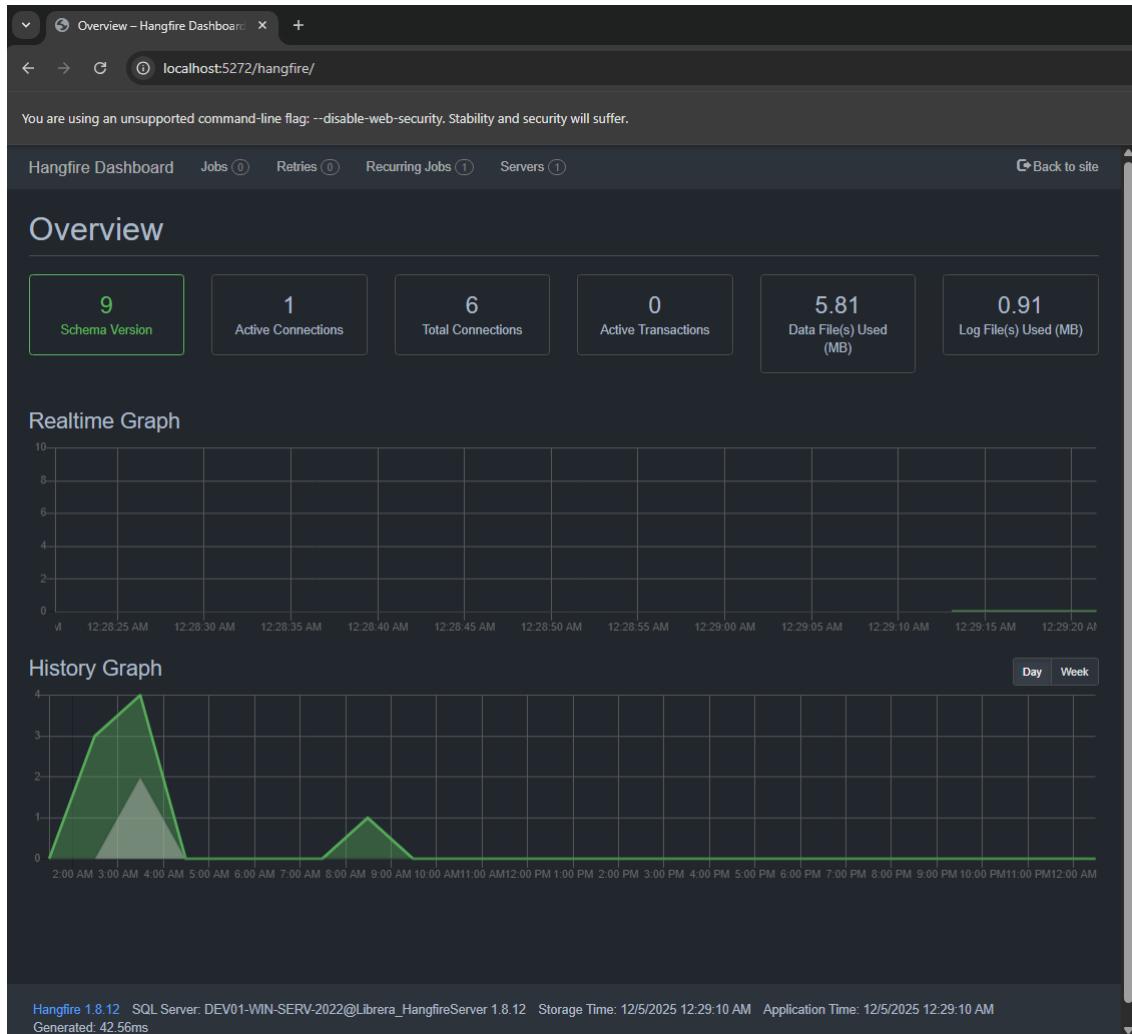

Succeeded	6 minutes ago (+39.010s)
Latency:	9.034s
Duration:	38.989s

Processing	+6.970s
Server:	DEV01-WIN-SERV-10292
Worker:	0955c009

Enqueued	+2.053s
Triggered by recurring job scheduler	

Created	6 minutes ago
---------	---------------

The next image image shows the process graph:

Here the recurring Job:

You are using an unsupported command-line flag: --disable-web-security. Stability and security will suffer.

Hangfire Dashboard Jobs (0) Retries (0) Recurring Jobs (1) Servers (0) Back to site

Recurring Jobs

Items per page: 10 20 50 100 500 1,000 5,000

<input type="checkbox"/>	ID	Cron	Time zone	Job	Next execution	Last execution	Created
<input type="checkbox"/>	BookIndexerJob	0 0 * * *	UTC	BookIndexerJob	in 15 hours	5 minutes ago	2 days ago

Total items: 1

Hangfire 1.8.12 SQL Server: DEV01-WIN-SERV-2022@Librera_HangfireServer 1.8.12 Storage Time: 12/5/2025 12:30:13 AM Application Time: 12/5/2025 12:30:13 AM Generated: 203.49ms

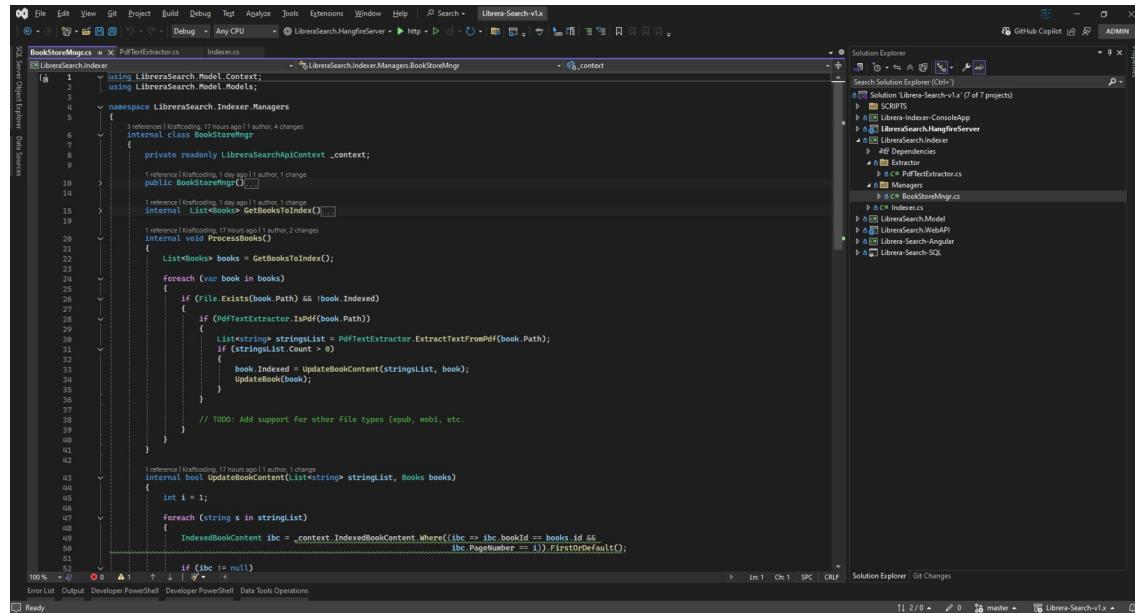

Here the Hangfire service definition for the Job:

```

Program.cs
1 var hangfireConnectionString = builder.Configuration.GetConnectionString("DefaultConnection");
2
3 builder.Services.AddHangfire(compatibilityLevel: Version.L70)
4     .UseSimpleJsonSerializer()
5     .UseRecommendedSerializerSettings()
6     .UseSqlServerStorage(
7         hangfireConnectionString,
8         new SqlServerStorageOptions
9         {
10             CommandBatchMaxTimeout = TimeSpan.FromMinutes(5),
11             SlidingInvalidateByTime = TimeSpan.FromMinutes(5),
12             QueueLimit = 10000000,
13             UseRecommendedIsolationLevel = true,
14             DisableGlobalLocks = true,
15         });
16
17 builder.Services.AddHangfireServer();
18
19 builder.Services.AddControllers();
20 builder.Services.AddEndpointsApiExplorer();
21 builder.Services.AddSwaggerGen();
22
23 //builder.Services.AddTransient<ITestRecurringJob, TestRecurringJob>();
24 //builder.Services.AddTransient<ITestJob, TestJob>();
25
26 builder.Services.AddTransient<IBookIndexerJob, BookIndexerJob>();
27
28 var app = builder.Build();
29
30 // Configures the HTTP request pipeline.
31 if (app.Environment.IsDevelopment())
32 {
33     app.UseSwagger();
34     app.UseSwaggerUI();
35 }
36
37 app.UseHttpsRedirection();
38 app.MapControllers();
39
40 // Change 'Back to site' link URL
41 var options = new DashboardOptions { AppPath = "http://localhost:4200/" };
42 // Make 'Back to site' link working for subfolder applications
43 //var options = new DashboardOptions { AppPath = VirtualPathUtility.ToAbsolute("~/") };
44
45 app.UseHangfireDashboard("hangfire", options);
46
47 RecurringJob.AddOrUpdate<IBookIndexerJob>(() => app.Services.GetRequiredService<IBookIndexerJob>().RunAsync(), Cron.Daily);
48
49 amn.Run();

RQ-02 | Indexer

The indexer is implemented by a library type project on which we have the PDF extractor and the c# method that the Hangfire service will call by a recurring job definition.

```
1  using LibreraSearch.Model.Context;
2  using LibreraSearch.Model.Models;
3
4  namespace LibreraSearch.Indexer.Managers
5  {
6      internal class BookStoreMngr
7      {
8          private readonly LibreraSearchDbContext _context;
9
10         public BookStoreMngr()
11         {
12             _context = new LibreraSearchDbContext();
13         }
14
15         internal void GetBooksToIndex()
16         {
17             foreach (var book in books)
18             {
19                 if (File.Exists(book.Path) && !book.Indexed)
20                 {
21                     if (PdfTextExtractor.IsPdf(book.Path))
22                     {
23                         List<string> stringList = PdfTextExtractor.ExtractTextFromPdf(book.Path);
24                         if (stringList.Count > 0)
25                         {
26                             book.Indexed = UpdateBookContent(stringList, book);
27                         }
28                     }
29                 }
30             }
31
32             // TODO: Add support for other file types (epub, mobi, etc.
33         }
34
35         internal void ProcessBooks()
36         {
37             List<Book> books = GetBooksToIndex();
38
39             foreach (var book in books)
40             {
41                 if (File.Exists(book.Path) && !book.Indexed)
42                 {
43                     if (PdfTextExtractor.IsPdf(book.Path))
44                     {
45                         List<string> stringList = PdfTextExtractor.ExtractTextFromPdf(book.Path);
46                         if (stringList.Count > 0)
47                         {
48                             book.Indexed = UpdateBookContent(stringList, book);
49                         }
50                     }
51                 }
52             }
53
54             internal bool UpdateBookContent(List<string> stringList, Books books)
55             {
56                 int i = 1;
57
58                 foreach (string s in stringList)
59                 {
60                     IndexedBookContent ibc = _context.IndexedBookContent.Where(ibc => ibc.bookId == books.id &&
61                     ibc.PageNumber == i).FirstOrDefault();
62
63                     if (ibc != null)
64                     {
65                         ibc.Content += s;
66                     }
67                 }
68             }
69         }
70     }
71 }
```

The indexer extraccts content form PDFs and stores it in DB.

RQ-03 | Model Layer

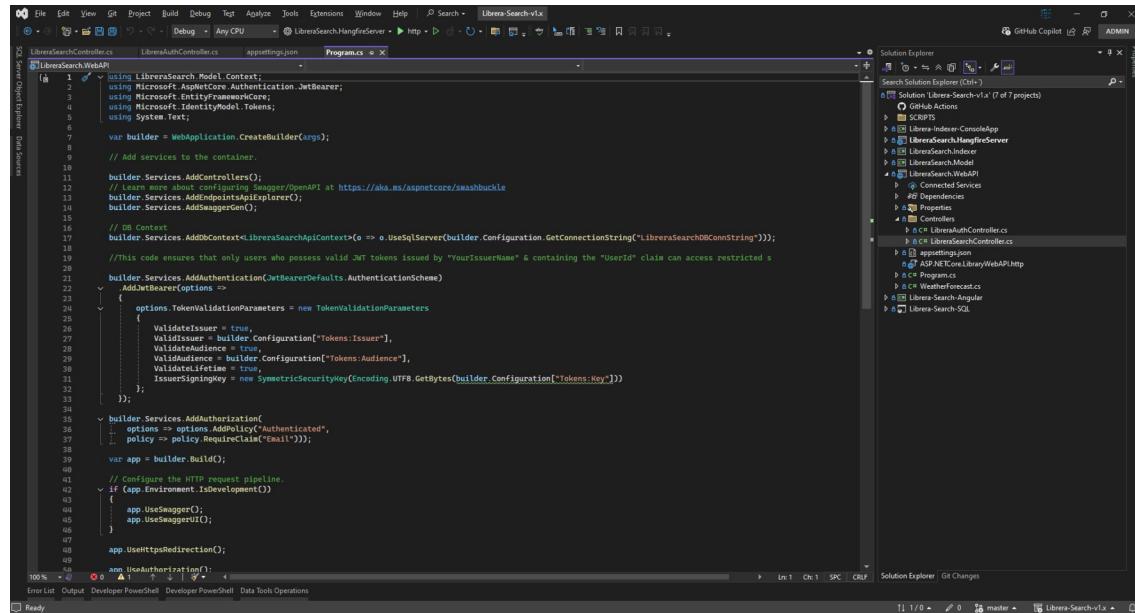

The model layer is managed by EF Core and LinQ is used to launch the queries.

RQ-04 | Web API

The Web API permits to the front-end application to execute CRUD operations my RESTful end-points. Those end-points are securitized by policy-based authorization.

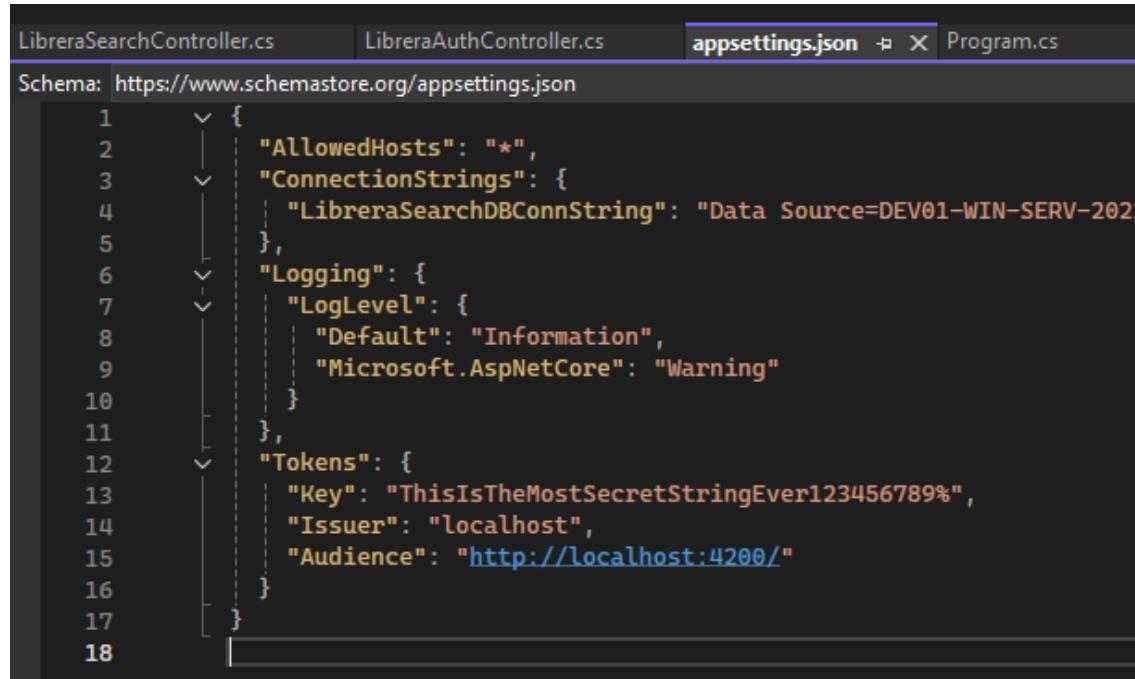

Here some images.

Web API Auth. service setup:

```
1  using LibreraSearch.Model.Context;
2  using Microsoft.AspNetCore.Authentication.JwtBearer;
3  using Microsoft.EntityFrameworkCore;
4  using Microsoft.IdentityModel.Tokens;
5  using System.Text;
6
7  var builder = WebApplication.CreateBuilder(args);
8
9  // Add services to the container.
10
11 builder.Services.AddControllers();
12 // Learn more about configuring Swagger/OpenAPI at https://aka.ms/aspnetcore/swashbuckle
13 builder.Services.AddEndpointsApiExplorer();
14 builder.Services.AddSwaggerGen();
15
16 // Context
17 builder.Services.AddDbContext<LibreraSearchDbContext>(o => o.UseSqlServer(builder.Configuration.GetConnectionString("LibreraSearchDBConnString")));
18
19 // This code ensures that only users who possess valid JWT tokens issued by "YourIssuerName" & containing the "UserId" claim can access restricted s
20
21 builder.Services.AddAuthentication(JwtBearerDefaults.AuthenticationScheme)
22     .AddJwtBearer(options =>
23     {
24         options.TokenValidationParameters = new TokenValidationParameters
25         {
26             ValidateIssuer = true,
27             ValidateIssuerName = builder.Configuration["Tokens:Issuer"],
28             ValidateAudience = true,
29             ValidateLifetime = true,
30             IssuerSigningKey = SymmetricSecurityKey(Encoding.UTF8.GetBytes(builder.Configuration["Tokens:Key"]))
31         };
32     });
33
34
35     builder.Services.AddAuthorization(
36         options => options.AddPolicy("Authenticated",
37             policy => policy.RequireClaim("Email")));
38
39
40     var app = builder.Build();
41
42     // Configure the HTTP request pipeline.
43     if (app.Environment.IsDevelopment())
44     {
45         app.UseSwagger();
46         app.UseSwaggerUI();
47     }
48
49     app.UseHttpsRedirection();
50
51     app.UseAuthorization();
52 }
```

Web API Tokens configuration:

```
Schema: https://www.schemastore.org/appsettings.json
1  {
2      "AllowedHosts": "*",
3      "ConnectionStrings": {
4          "LibreraSearchDBConnString": "Data Source=DEV01-WIN-SERV-2022"
5      },
6      "Logging": {
7          "LogLevel": {
8              "Default": "Information",
9              "Microsoft.AspNetCore": "Warning"
10         }
11     },
12     "Tokens": {
13         "Key": "ThisIsTheMostSecretStringEver123456789%",
14         "Issuer": "localhost",
15         "Audience": "http://localhost:4200/"
16     }
17 }
```

Web API securitized end-points:

The screenshot shows the Visual Studio IDE interface with the following details:

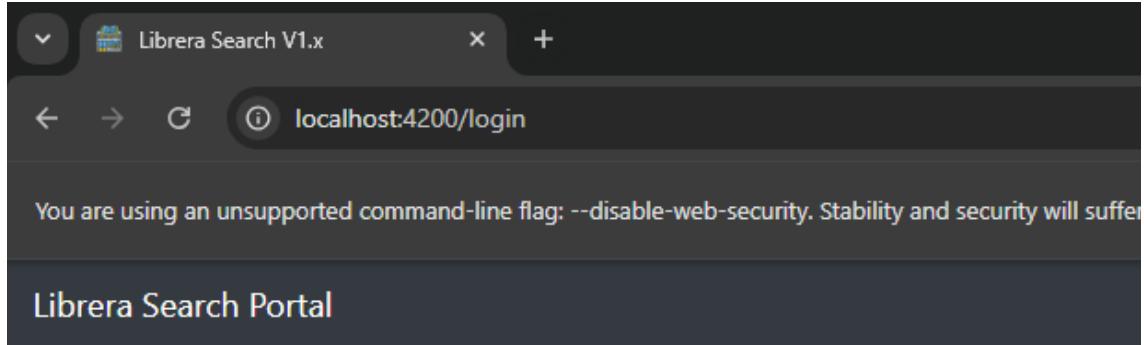

- Solution Explorer:** Shows the solution structure for "Libera-Search-v1.x" containing seven projects:
 - Libera-Search-ConsoleApp
 - Libera-Search-HanifServer
 - Libera-Search-Indexer
 - Libera-Search-Model
 - Libera-Search-WebAPI
 - Libera-Search-WeatherForecast
 - Libera-Search-Angular
- Code Editor:** Displays the content of the file "LiberaAuthController.cs" under the "LiberaSearch-WebAPI" project. The code is a C# class for managing user authentication.
- Status Bar:** Shows the current file is "LiberaAuthController.cs", with line 1, character 35, and a total of 100% completion.
- Toolbars and Menus:** Standard Visual Studio menus like File, Edit, View, Project, Build, Debug, Test, Analyze, Tools, Extensions, Window, Help, and a GitHub Copilot icon.

RQ-05 | Front end App

The front end app is built in Angular 16.

Here some images.

Search by title list and details:

The screenshot shows a web-based application titled "Librera Search V1.x" running on "localhost:4200/LibreraSearch". The interface includes a navigation bar with links for "Librera Search Portal", "Librera Search", "Add", "Text Content Search", "Hangfire Dashboard", and "Log out". Below the navigation is a search bar with a placeholder "Search by title" and a "Search" button. The main content area is divided into two sections: "Librera Search List" and "Librera Search". The "Librera Search List" section displays a single item: "Kali inside Proxmox (Guest VM)" with the subtitle "Linux Encrypted Filesystem with dm-crypt". A red "Remove All" button is located below this item. The "Librera Search" section provides detailed information about the item, including its modified date (2025-12-05T00:00:00), title (Kali inside Proxmox (Guest VM)), author (Kali), series (1), ID (isbn:0001), publication date (Nov 10, 2025), publisher (Linux), language (Eng), tags (cybersecurity), formats (pdf), path (E:\TEST\PDF\Kali inside Proxmox (Guest VM).pdf), and indexed status (false). An "Edit" button is located at the bottom right of the detailed view.

Search by content page details:

The screenshot shows a web browser window titled "Librera Search V1.x" with the URL "localhost:4200/LibreraTextSearch". The page header includes "Librera Search Portal", "Librera Search", "Add", "Text Content Search", "Hangfire Dashboard", and a "Log out" button. Below the header is a search bar with the word "store" and a "Search by Text Content" button. The main content area is titled "Librera Text Search List" and displays a single search result. The result includes the following details:

Title: Linux Encrypted Filesystem with dm-crypt

Authors: Joe Doe

PageNumber: 1

Content:

```
Linux Encrypted Filesystem with dm-crypt An encrypted filesystem will protect against bare-metal attacks against a hard drive. Anyone getting their hands on the drive would have to use brute force to guess the encryption key, a substantial hindrance to getting at your data. Windows and Mac OS X each provide its own standard cryptofs tools while Linux, of course, provides many tools to accomplish the task. The tool of choice these days, it seems, is dm-crypt . Invoked with the userspace cryptsetup utility, dm-crypt provides a fairly clean and easy-to-use cryptofs tool for Linux. Additionally, CentOS 5 includes an improved version of dm-crypt that supports LUKS . LUKS is an upcoming standard for an on-disk representation of information about encrypted volumes. Meta- data about encrypted data is stored in the partition header, and allows for compatibility between different systems and support for multiple user passwords. Besides that, GNOME and HAL have support for handling LUKS volumes, and can automatically prompt for a password if a removable medium with a LUKS volume is attached. If you do not require compatibility with older CentOS versions or systems that do not support LUKS, it is advised to use the LUKS scheme. The commands for setting up encrypted LUKS volumes are also described in the examples in this article. Here are Scripts to automate creation, un-mounting, and remounting of LUKS encrypted filesystems following the method described below.
```

1. Required Packages Before getting started, make sure all the requisite packages are installed:

- cryptsetup (cryptsetup-luks for CentOS-5)
- device-mapper
- util-linux

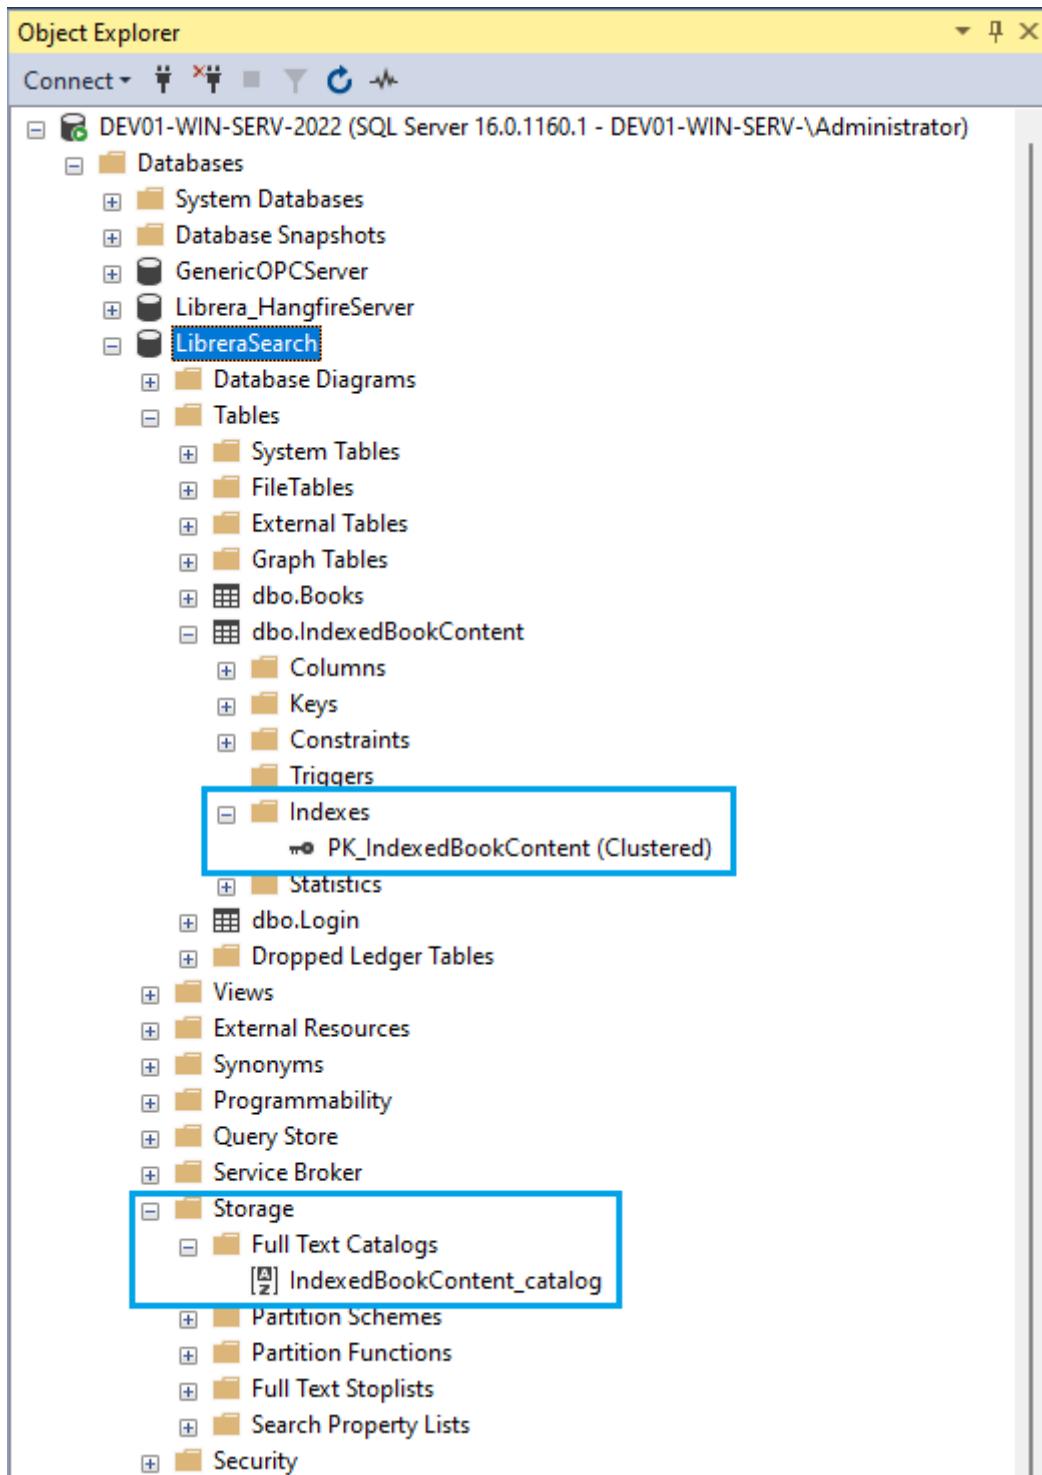

It's likely, however, that they're already present on your system, unless you performed a very minimal installation.

2. Initial FS Creation I typically encrypt files, not whole partitions, so I combine dm-crypt with the losetup loopback device maintenance tool. In the bare language of the Unix shell, here are the steps to create and mount an encrypted filesystem.

```
# Create an empty file sized to suit your needs. The one created # in this example will be a sparse file of 8GB, meaning that no # real blocks are written. Since we will force block allocation # lateron, it would not make much sense to do this now, since # the blocks will be rewritten anyway.
dd of=/path/to/secretfs bs=1G count=0 seek=8
# Lock down normal access to the file
chmod 600 /path/to/secretfs
# Associate a loopback device with the file
losetup /dev/loop0 /path/to/secretfs
```

RQ-06 | Database

The database is hosted by M. SQL Server 2022, all the schemas and T-SQL logic is in the project. Full-Text Search feature is needed, as we see in the next image:

Deployment

To do.

Software life cycle management

To do.

Annexes

A console App is added to test the indexer.

A script is added to launch Chrome avoiding CORS
